Frontend Challenge

Thank you for taking up the challenge. We want to know more about your skills. Our challenge for you is to create a minimal page.

You will have to focus on design and trying to replicate everything you can. The buttons no need to be functional

Focus on doing components that are reusable but try not to over componentizes.

This is the design

https://www.figma.com/file/0ZLi7UUCB4hOQQllTmtgG6/Prueba?node-id=1%3A212

We also want to integrate an API to see how the climate is doing. We want to know the daily temperature_max and temperature_min

https://api.open-meteo.com

Don't forget to add the timezone GMT. Show it somewhere in the site

Extra points

- Implement a custom hook for fetching the Climate change
- Implement Jest
- Implement the modal in material ui
- Use transalations i18n. Only one language.
- Implement a fake login and store fake user data in the sessionStorage. Protect the only page that you have, if the user is logged in the you can access the page. Please provide user and password for testing

This is the repo for you to start with. Feel free to use whatever component already there, and edit them if you want to

https://github.com/lflescano/front-codechallenge

Tips

● Don't worry if you don't finish it. Try your best. Explain what can be improve
● Once You finish, reply to the email with the link to your repo (public repo) with your test
